

## Web-based Version Management

USSMC provides Web-based Version Management that organizes, manages and protects software assets, supporting effective software configuration management (SCM) across their entire enterprise. The intuitive, graphical user interface, based on Windows Explorer concepts, is easy to use, and encourages team members to apply SCM practices consistently and effectively.

### USSMC Web-based Issue Management Experience

We can provide Web-Based Issue Management that captures, manages and communicates the many feature requests, defect reports, changes and project issues that can consume your organization's time and waste its creativity. Fully scalable across the enterprise, Issue Management has helped our customers manage the complexity of change by keeping them coordinated and communicating at every step-and by making it easy and intuitive. Our customers are free to create higher quality e-business applications, track and manage Web changes, and deliver software faster to ensure your competitive advantage.

### USSMC Web-based Bug Tracking Experience

USSMC is a company leading their customers in Web-based Bug Tracking software solutions in the market today. Bug tracking and reporting is critical to software quality assurance, and this solution offers numerous benefits. USSMC currently solves customer bug tracking problems, whether their software team is centrally located or distributed across the globe. The ease-of-use, the browser-based interface, and the high availability of bug tracking software via the Internet has made it possible for both internal and external software developers to access the USSMC web-based database repository from any location.

The web-based defect tracking solution eliminates the need for software licensing or installation, and software enhancements are provided by USSMC. Served from a highly secure web data center, USSMC currently provides a highly customizable bug tracking solution that enables the entire development team to communicate effectively and work in real time, using one central bug database. There is no investment in training, code development, or software technical support.

USSMC currently provide a invaluable defect tracking tool throughout the entire software contract tasks lifecycle, making it easy to monitor, report, and assign bugs to the development team. The bug database is exportable for use in specific applications such as Excel, Access, or any other application, giving the project management team full access to project databases. Permission and security controls allow for group-level and end user access as projects may require. **Our corporate experience utilizing these techniques comes from working for; NASA Goddard Space Flight Center, Department of the Interior, Nextel Communications and the Bureau of Engraving and Printing.**

### **Business Software Collaborations with Application Configurable Environments**

One of the core strategies of the USSMC, Inc. business plan is to develop associations and partnerships with third party companies. These companies provide software and software services within our sphere of competencies. We are presently working with one such company, and are reviewing another such partnership with another company involving special resource planning software.
